

Stella di Caffè

Be Unique

Stella precision filter baskets

- Using advanced fabrication technologies, UNIC is able to produce filter baskets of uncompromising quality. Each one is inspected and tested to make sure that hole patterns and sizes are consistent throughout the base of the basket. This enable us to produce a quality extraction, free of improper water channeling, time after time.

Independent Per Group Touch Control Boxes

- Each electronic group control box is independent and available with up to 5 dosing selections. Drink selections are sensed through capacitance, rather than pressure, making dosing selections almost effortless.
- The group control boxes communicate with each other serially to post information on the main control screen.

Central Control LCD Touch Screen

- 4,2" color LCD screen vividly displays menu options and allows for data transfer through available USB port.
- Evolutive lighting (color/intensity settings) through LED (RGB).
- Intuitive programming and ease of use thanks to touch screen.
- Automatic night/day mode with timer program for energy saving.
- Programming menus: drinks counter, automatic cleaning cycle, alarms for regular timed maintenance and water filtration replacement.

Steam Glide Lever

- High precision manual steam wand controlled horizontally through a ceramic cartridge.
- Hot water outlet with adjustable flow.

Dosamat

- Exclusive patented technology enables the Stella to recognize the size of the portafilter inserted (single, double or triple) and automatically dose the corresponding volume. All volumes are completely adjustable and up to 6 different settings can be stored for each group.

Steamair

- Exclusive system that automatically foams milk with temperature control.

Easy-Lock Portafilter

- Hydraulically assisted locking group for a perfect seal with minimal effort.

Energy Grip

- Filter handle 6° inclined, made with special rubber that absorbs shocks and vibrations.

Automated pressure infusion

- One option available for the Stella is an automated pressure infusion system. By placing a precision pressure sensor in each coffee boiler, and adding a simple solenoid valve to each brewing system, the Stella can be programmed to meet all of your pressure profiling needs. It is easily adjusted and set through our convenient touch screen interface.

Stella di Caffè is an evolved multi-boiler espresso machine that has pioneered systems in intelligent energy distribution. This results in consistent brewing temperatures through precise PID control.

Multi independent 1,65 L coffee boilers 2000 W per group, fully working and controlled independently from each other.

Use of maximum simultaneous power 6700 W limiting power consumption while ensuring optimal performance of each function.

Pre-infusion: mechanical with 3 lung sizes (0, 3, 6 seconds) / electronic progressive pre-infusion up to 10 second (option per group).
